Description

Enterprise 4300

The WilsonPro **Enterprise 4300** in-building cellular amplifier is the culmination of the latest cell signal boosting innovations—centered on its all-new Multi-Tower Targeting technology.

Depending on cell tower locations, it can run up to three outdoor antennas; each dedicated to a specific frequency band to collectively amplify signals from multiple towers. Based on user need or preference, Enterprise 4300 can also utilize “common mode” as its default; requiring only a single outdoor antenna to deliver enhanced cell signal coverage to its four indoor antennas.

With wired or LTE access (using the built-in cellular modem) to the WilsonPro Cloud for remote functionality, integrators and building managers can remotely manage, monitor, and adjust the Enterprise 4300 using a smartphone or tablet. Immediate notifications are received via email or text. Designed to reach towers at greater distances, it also produces up to 26 dBm in uplink and up to 17 dBm in downlink—making it one of the most powerful amplifiers within its price range.

Highlights:

- **Enhances cell coverage area up to 100,000 sq. ft**
- 26 dBm max uplink
- Up to 70 dB Gain
- 4 indoor antenna ports, up to 17 dBm each

- Remote access through WilsonPro Cloud
- Multi-Tower Targeting Technology
- Designed for wall-mount configuration.

[A rack-mount option is available! See Enterprise 4300R.](#)
